SMS Business Software Solution GmbH  
Kirchheim/ Teck  
[www.sms-erp.de](http://www.sms-erp.de)

APLIKO GmbH  
Gelsenkirchen  
[www.apliko.de](http://www.apliko.de)

Kingeter has been a typical Swabian medium-sized company since 1927 and is currently managed by the fourth generation.

The know-how that has matured over decades is expanded through constant further development. Reliability, highest quality and permanent improvement of the processes are reflected in the growth of the company.

At Kingeter, the following applies: "Only those who consistently pursue their goals can also grow steadily."

In the field of series production, Kingeter specializes primarily in small series with small quantities. Parts are mainly produced for the automotive industry, but also for some non-automotive companies.

Kingeter's strength lies in the flexible production of various stamped, formed and bent parts. The expert employees specialize in producing different products on a daily basis.

For a number of years, Kingeter has focused more and more on the highly interesting area of the classic and vintage car industry, primarily for Porsche.

Tool making is one of the company's absolute core competencies. This includes, in particular, complex progressive dies or difficult prototype projects (e.g. decorative strip dies, dies for structural parts and safety-relevant parts). In the area of prototyping, Kingeter is always at the customer's side with advice and action in the development, improvement and production of the new vehicles.

### Markus Kingeter, managing partner, about the application and the implementation project:

*„As a long-standing supplier, we were very familiar with the requirements of our customers. The aim of our project was to introduce existing isolated solutions and workarounds using a solution with little effort and full integration of all functional areas.*

*With SAP Business One and the modules used for production from SMS and the automotive EDI and logistics solution from APLIKO, we have found and implemented the ideal solution for us.*

*Contrary to my expectations, the first deliveries were made to our customers on the day of the go-live. Goods, containers, labels, shipping documents and the EDI transmission were received correctly by the customers.*

*In addition to the planned and reported production steps, the features of the solution in the shipping area are also convincing. The entire shipping process can be carried out before the item is available, even with mixed containers and their labeling including the correct weights.*

*With this solution, we are optimally positioned for the constantly growing and changing requirements of our customers in the long run."*
